

# Java For Dummies

## Running the book's code in NetBeans

1. Launch NetBeans.
2. In the NetBeans main menu, select File⇒Open Project.

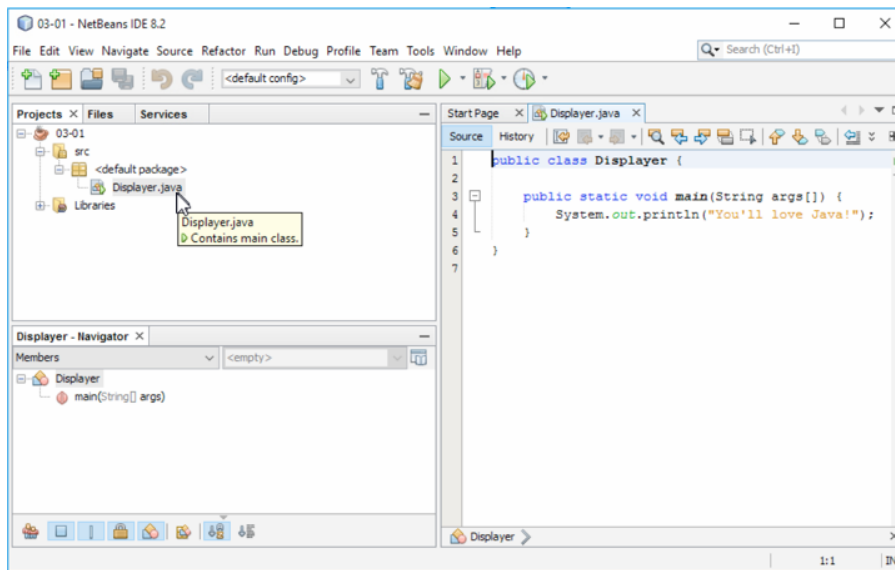

3. Navigate to the uncompressed folder containing code that you downloaded from the book's website.
4. In that folder, select the subfolder whose code you want to run. For example, to run the code from Listing 3-1, select the 03-01 subfolder.

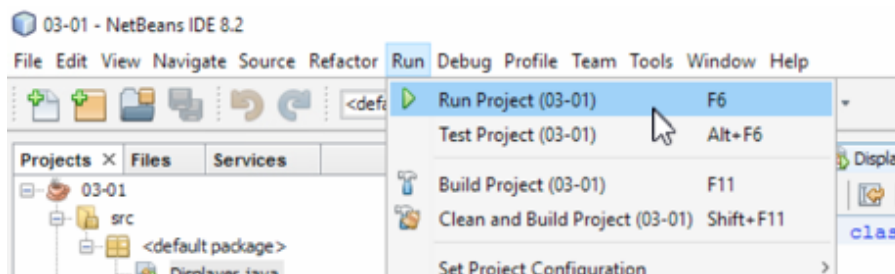

5. Click the dialog box's Open Project button (or whichever button is most appropriate on your computer's dialog box).

6. Your project opens in NetBeans.
7. In NetBeans, the leftmost panel is named the Projects window. In this window, expand the folders until you see the name of the class in the listing. For example, in Listing 3-1, the class's name is Displayer. Double click this branch in the Project tool window to see the Displayer class's code.

8. To run the Displayer program, select Run⇒Run Project in the NetBeans menu bar.

9. In the little dialog box that appears, select the name of the class that you want to run. For example, to run the code in Listing 3-1, select Displayer.
